MOTHBEAN

Botanical Name - *Vigna acontifolia*
Synonym - Moth
Origin - India

**Introduction**
Mothbean (*Vigna acontifolia*) is a native crop of hot and dry habitats of northern and western parts of India. These very adjusting abilities have rendered this crop as an indispensable component of cropping system prevailing in arid regions. This crop is used as a source of food, feed, fodder, green manuring and green pasture. Green pods are delicious source of vegetables. Being a pulse, it is a cheap source of vegetable protein for balancing nutritional deficiency.

**Crop Status**
A total of 9.26 lakh hectares and 2.77 lakh tonnes of Moth production was recorded in the country during the twelfth plan (2012-15) period. Area and production of moth bean has been highest in Rajasthan (96.75% and 94.49%) followed by Gujarat (2.38% and 3.6%). However, yield of Rajasthan (292 kg/ha) was below the National average yield of (299 kg/ha).

**Climate**
It can tolerate high temperature without any adverse effect on flowering and fruit development. Optimum temperature requirement for growth and development is 25-37 °C. Bulk of the cultivation is, confined to dry-lands of arid zone with 250-500 mm rainfall requirement with arrangement of proper drainage.

**Varieties**
Other than the following specific varieties may be selected from table given below.

a) **Normal maturity group** (> 90 days) Moth Guj. 1 (MG-1), Jadra (IPCMO 943), Jwala (IPCMO-926), IPCMO 880 (26% Protein)

b) **Medium maturity group** (70-90 days) with uniform rainfall throughout season (ii) IPCMO 912 (ii) CZM 1 (both 75-80 days duration)

c) **Early maturity group** 60-65 days, higher yield, escape terminal drought especially suitable for late season, drought areas, resistant to YMV.
State-wise recommended varieties

Field Preparation
In a good rainfall year, one ploughing with mouldboard plough and a cross harrowing serve the purpose in arid conditions of western Rajasthan. Other alternative is Sweep Cultivation with a ferti seed drill (developed at CAZRI) that can also be used for inter cultivation in wide spaced crop.

Sowing Time
With the onset of monsoon. Generally start with first soaking rain to second rain after onset of monsoon. Optimum sowing time 2\textsuperscript{nd} to 3\textsuperscript{rd} week of July. Delay in sowing may result in poor growth, poor germination, increased seedling mortality and incidence of pest and diseases and more conspicuously moisture stress at the flowering, the most critical stage.

Seed Rate & Spacing
10-15 kg/ha (short statured, spreading to erect RMO-40 type) for grain and 4-5 kg for mixed crop. For fodder purpose 20-25 kg/ha seed required. Spacing should be maintained as 30-45 cm x 10-20 cm.

Seed Treatment
Seed treatment with 2 g Thiram + 1 g Carbendazim / kg of seed. After fungicide treatment seed inoculation with Rhizobium and PSB culture @ 5-7 g/kg of seed.

Irrigation
It is cultivated in dry land and rainfed condition but in long dry spell one irrigation should be given at pod formation stage.
Cropping System

- Generally grown as single (mono) crop in a year mixed or as a sole crop. However, in a year of good rainfall, it can be rotated with mustard.
- Mixed cropping with pearl millet, cluster bean, cowpea, mung & sesame in risk prone areas during monsoon. Varieties recommended are RMO 40 & FMM 96 of mothbean and HHB 67 of Bajra.
- Inter cropping (2:1) - 2/3 rows of mothbean in between two rows of pearl millet.

Plant Nutrient Management

Besides their N-fixing capacity they have greater power for absorbing less soluble form of 'P'. Recommendation is 20-25 tonnes FYM for improving physical condition and improving water holding capacity of soil along with 10 kg N + 40 kg P₂O₅/ha as basal at the time of sowing or last field preparation.

Weed Management

Application of Pendimethalin 30 % EC @ 0.75 -1 kg a.i. / ha as pre emergence and one hand weeding at 25-30 days after sowing.

Plant Protection Measures

Pest and diseases in mothbean and their management

</table>

- i. Undecomposed FYM or composed should not be used.
- ii. Soil application of Phorate 10 G @ 10 kg/ha or Chloropyrifos 1.5 % dust @ 20-25 kg/ha before sowing.
Storage Pest

| viii. | Pulse beetle (*Calosobruchus chinensis*) | During storage | Regular | i. Carry Seed moisture level below 10% before storing.  
ii. Fumigation-Mixing/Smearing with neem leaves/cake & edible oils. |

YMV = Yellow Moasaiic Virus

<tr>
<td>Bacterial leaf spot/ blight</td>
<td>Many small, large and irregular brown necrotic spots appear on leaves and in the extreme cases, leaf may fall down</td>
<td>i. Soak the seeds in 500 ppm (0.5g/liter) Streptomycine solution for 30 min. before sowing followed by two sprays of Streptomycine (0.01%) combind with 3 g of Copper Oxylchloride per litre at an interval of 12 days is recommended.</td>
</tr>
<tr>
<td>Yellow mosaic virus</td>
<td>Diseased plant leaves are yellow and small in size.</td>
<td>i. For controlling white fly spray of Dimethoate 30 EC @ 1.7 ml/liter or Imidacloprid 17.8 SL @ 0.2 ml / liter of water and repeat the spray after 15 days interval.</td>
</tr>
</tbody>
</table>
| Anthracnose (*Colletotrichum spp.*) | Circular, black sunken spots with dark centres and bright red or orange margins on leaves and pods. In severe infection affected parts wither off. | i. Seed treatment with Thiram 3 g/kg of seed.  
ii. Spraying the crop with Mancozeb 75 WP @ 2.5 g/litre of water. |

Harvesting, Threshing & Storage

Crop is ready to harvest when pods get mature and turn brown. Plant show drying symptom or yellowing of leaves. Estimated Post harvest losses are 9-10% during threshing transportation, processing and storage. Sun drying, heat treatment, and storage at low temperature with low moisture percentage in seeds (8-9%), is recommended.

Yield

With adoption of improved technology 6-8 quintal grain yield and if it is cultivated for fodder 12- 25 q/ha green fodder yield (depend on variety) can be achieved.

Recommendation to achieved higher production

I) Deep summer ploughing once in 3 years.
ii) Seed treatment should be done before sowing.
iii) Application of fertilizer should be based on soil test value.
iv) Weed control should be done at right time.
v) Adopt integrated approach for plant protection.
- For technical information of crop production please contact to district KVK/nearest KVK.
- To avail benefit from Central and State Government running schemes for crop production (ploughing, fertilizers, micronutrient, pesticide, irrigation equipment), agricultural implements, storage infrastructure etc., please contact to your DDA/SADO office.
